

Sivan

The clearing layer between digital dollars and African bank accounts.

USDC in. Naira out. Settled in seconds, inside Telegram, WhatsApp and the web.

Circle Developer Grant | Abuja, Nigeria | sivantech.online

Getting paid from abroad still costs Nigerians a week and a cut.

3 to 5 days

Typical settlement

Correspondent banking, per World Bank remittance data.

5 to 10%

Lost to intermediaries

FX spread plus fees, stacked across each hop.

Seed phrases

The crypto alternative

Gas tokens, wrong network transfers, unrecoverable loss.

A freelancer in Abuja invoicing a client in London can hold USDC in 2 seconds. Turning it into spendable naira is the part that is still broken, and it is the only part that matters to them.

Sivan makes USDC settle like a local bank transfer.

01

Receive

USDC arrives on Base or Solana, or from a chat message.

02

Hold

Custodied balance, double entry ledger, no seed phrase.

03

Convert

Quoted in naira with the fee shown before confirming.

04

Settle

Paid into a Nigerian bank account through NIBSS rails.

What makes it different

- **Chat native.** The product lives where users already are, not in a new app.
- **No gas, no seed phrase.** Wallets are provisioned and sponsored for the user.
- **Escrow built in.** Milestone release for service work, not just transfers.
- **The fee is shown first.** Quoted before confirmation, never discovered after.

Running in production, not a prototype.

Web application	app.sivantech.online	Live
Telegram bot	t.me/Sivan_Ai	Live
NGN off ramp	Naira settlement to Nigerian bank accounts	Live
Identity verification	BVN and NIN against the national source	Live
Escrow agent	Milestone based release	Live
WhatsApp layer	Service deployed, routing in progress	In progress

Settlement, fees, limits and identity checks are enforced server side and covered by an automated test suite that runs on every change.

THE PRODUCT

One message. Dollars land as naira.

No seed phrase, no gas token, no exchange account. The user sees a balance and a bank account, which is the only mental model they already have.

- **Settlement confirmed in chat**

The receipt arrives where the request was made.

- **Verified identity tiers**

Level 1 bank, Level 2 BVN or NIN, each unlocking a ceiling.

- **Naira paid to a real account**

NIBSS rails, not an IOU inside a wallet.

Built for money, which means built to refuse.

Safety properties

- **Atomic double entry ledger.** Every movement balances or it does not happen.
- **Cumulative limits.** Ten transfers under a line still add up, so the window totals.
- **Tiered verification.** Bank, then identity, then enhanced.
- **Provider failover.** An outage retries elsewhere. A rejection never does.

Surface

- **Chains.** Solana and EVM, Base and Ethereum on one address.
- **Wallets.** Privy and Bridge, sponsored gas, no seed phrase.
- **Rails.** Nigerian bank settlement, BVN and NIN checks.
- **Interfaces.** Web, Telegram, WhatsApp and a developer API.

The test suite asserts refusals, not just successes. A payments bug that returns a 200 where a 401 belongs is invisible to a suite that only checks the happy path.

Engineering depth is the proof point today.

174

Automated test scripts

Covering fees, limits, ledger and identity.

6

Production services

Payments, escrow, auth, AI, Telegram, WhatsApp.

1%

Live take rate

Charged today on every off ramp conversion.

\$0

Outside capital raised

Bootstrapped to a live production system.

Where we are honest about the stage

- **Soft launch.** The platform is live and functional. User volume is early and we are not going to dress it up.
- **The moat is the rails.** A working naira off ramp with identity verification is months of compliance work, and it is done.

Three revenue streams, all charging today.

OFF RAMP

1%

USDC to naira conversion

Returned live by our public fee endpoint today. Not a projection.

ESCROW AND SERVICE AGREEMENTS

2.5%

on naira, 1.5% on USDC

Priced per currency, plus a fixed component of NGN 50 or \$0.50.

PEER TO PEER TRANSFERS

Under \$100 **0.50%**

\$100 and above **0.25%**

Minimum per transfer **\$0.25**

New recipient account **\$0.30**

The floor covers gas and rail cost.

Why the floor matters

A \$20 transfer pays 1.25% effective, not 0.50%, because the \$0.25 floor dominates until roughly \$50. Small transfers stay profitable.

Take rate against the market

Traditional remittance into Nigeria costs 5 to 10 percent. We clear the same corridor at 1 percent and still hold a margin on all three streams.

USDC is the settlement asset. Circle closes the gaps we have.

Integrated today

- USDC as the unit of account across the platform
- USDC balances, transfers and off ramp conversion
- Multi chain USDC on Solana and EVM

Requested in this grant

- CCTP for native burn and mint rebalancing
- Iris attestation for cross chain settlement
- Programmable Wallets for seedless onboarding
- Paymaster for sponsored gas at scale

Today liquidity is rebalanced manually across chains. CCTP removes that operational risk, and Programmable Wallets removes the last onboarding step that still loses non crypto users.

USE OF FUNDS

10,000 USDC, two milestones, both shippable.

MILESTONE 1

CCTP liquidity rebalancer

A treasury daemon watches vault balances across Base, Solana and Celo and rebalances with native burn and mint through CCTP and the Iris attestation API, removing manual bridging. Shipped alongside MCP tooling so AI agents can settle programmatically.

6,000 USDC

Month 1

DONE WHEN

Each chain within 15% of target

14 days, zero manual bridges

Agent settles via MCP

MILESTONE 2

Programmable Wallets onboarding

Circle Programmable Wallets across web and chat, so a user gets a multi chain USDC wallet without ever seeing a seed phrase. Session keys and sponsored gas remove the last two reasons a first time user drops off.

4,000 USDC

Month 2

DONE WHEN

Signup with no seed phrase

Gas sponsored end to end

Wallet live on web and chat

Everyone solves one half. The handoff is the gap.

	Chat native	Non custodial USDC	Direct NGN settlement	Escrow + milestones
Sivan				
Yellow Card, Onafriq				
Binance P2P				
Wise, remittance apps				
Self custody wallets				

The point is not that rivals are weak

Yellow Card has licences we do not. Binance has liquidity we will never match. What none of them do is take a stablecoin out of a chat message and put naira in a bank account, with escrow in between, in one flow. That handoff is the product.

Nigeria is the wedge, not the ceiling.

\$20bn+

Annual remittances to Nigeria

One of the largest corridors in Africa.

Top 3

Global crypto adoption

Nigeria consistently ranks at the top by grassroots use.

90m+

Chat app users

WhatsApp and Telegram are the default interface.

Expansion path

- **Ghana is next, and the rail is already built.** Our settlement provider clears GHS today and the currency threads through the bank lookup.
- **The gate stays shut on purpose.** Ghana is held back until its identity resolver is tested, not shipped half done.
- **The hard part is done once.** Chat native distribution plus a licensed off ramp is the pattern, and it ports.

Building for the market we live in.

Samson Micheal

Founder, CEO and Technical Product Engineer

Full stack fintech and blockchain engineer in Abuja. Designed and built the ledger, settlement engine, identity layer and chat interfaces running today.

Jonathan Hart

Co Founder

Partners on product direction, growth and commercial strategy, taking the platform from a working system to a distributed one.

Why this team

- **We are the user.** Cross border payment friction is a daily fact here, not a market study.
- **Shipped, not specced.** A live production system with real bank settlement already exists.
- **Compliance first.** Identity verification and AML policy were built before growth, not after.

THE ASK

10,000 USDC to remove the last two points of friction.

Cross chain liquidity that rebalances itself, and an onboarding flow with no seed phrase in it. Both are Circle primitives, and both are the gap between a working product and a scalable one.
