

Sivan

A live payments product, bringing African fiat rails to Starknet.

USDC settles into a Nigerian bank account in seconds today. Starknet Account Abstraction removes the last thing standing between that and everyone else.

Starknet Foundation Seed Grant | \$25,000 in STRK | Abuja, Nigeria

THE PROBLEM

Getting paid from abroad costs Nigerians a week and a cut.

3 to 5 days

Typical settlement

Correspondent banking, per World Bank data.

5 to 10%

Lost to intermediaries

FX spread plus fees, stacked at every hop.

Seed phrases

The crypto alternative

Gas tokens and wrong network transfers.

A freelancer in Abuja invoicing a client in London can hold USDC in two seconds. Turning it into spendable naira is the part that is still broken, and it is the only part they care about.

WHAT ALREADY WORKS

This is a running business, not a proposal.

Web application	app.sivantech.online	Live
Telegram bot	t.me/Sivan_Ai	Live
NGN off ramp	Naira paid to Nigerian bank accounts in seconds	Live
Identity verification	BVN and NIN against the national source	Live
Escrow agreements	Milestone based release with dispute trail	Live
Starknet	This grant. Nothing shipped yet.	Not started

The last row is the honest one. We are not claiming a Starknet integration that does not exist yet, we are asking for the funding to build it.

THE PRODUCT

One message. Dollars land as naira.

No seed phrase, no gas token, no exchange account. The user sees a balance and a bank account, the only mental model they already have.

- **Settlement confirmed in chat**

The receipt arrives where the request was made.

- **Verified identity tiers**

Bank, then BVN or NIN, each unlocking a ceiling.

- **Naira paid to a real account**

Local bank rails, not an IOU inside a wallet.

Account Abstraction is not a feature to us. It is the blocker.

What Starknet solves that our current chains do not

- **Native AA means no seed phrase.** Today onboarding a non crypto user means explaining key custody. On Starknet the account IS a contract.
- **Paymasters mean no gas token.** A Nigerian user should never have to acquire STRK or ETH before receiving money.
- **Session keys make chat viable.** A Telegram flow cannot prompt for a signature on every step and survive.
- **Low fees make small transfers work.** Our median transfer is small. On most L1s the fee eats the payment.

What we bring to Starknet

- A live fiat off ramp into Nigeria, already working
- Identity verification against the national registry
- A chat distribution surface on Telegram and WhatsApp
- An escrow state machine with a dispute trail
- Open source starknet.js adapter and agent tooling

Starknet gets a payments corridor it does not have today.

We are porting a tested vault, not starting from a blank file.

01 Port a tested vault, keep the x402 rail

Escrow already settles through x402 via the PayAI facilitator, live today. Our Celo vault handles release and deadline refunds: 34 tests, 6 invariants over 12,800 fuzzed calls. Starknet gets both.

02 starknet.js Account Abstraction adapter

TypeScript adapter with native account abstraction, session keys and paymaster sponsorship, wired into the Sivan settlement engine that runs today.

03 Agent tooling for the ecosystem

An MCP tool and adapter so any agent framework can settle on Starknet, not just ours. This is the part that outlives our own product.

Native USDC on Starknet: 0x033068F6539f8e6e6b131e6B2B814e6c34A5224bC66947c47DaB9dFeE93b35fb

USE OF FUNDS

\$25,000 in STRK, six weeks, every deliverable in our own hands.

MILESTONE 1

Settlement adapter and Account Abstraction

\$8,500

Week 2

Sivan StarknetAdapter on Sepolia with native account abstraction, session keys, paymaster sponsored gas and the existing x402 escrow rail.

DONE WHEN: Public PR, Sepolia address, passing tests

MILESTONE 2

Agent gateway and chat integration

\$8,500

Week 4

Starknet settlement exposed as MCP agent tooling. Telegram and web execute Starknet transfers and milestone agreements using session keys.

DONE WHEN: Demo video: agent and human settle on Starknet

MILESTONE 3

Mainnet launch and fiat bridge

\$8,000

Week 6

Starknet USDC settling into Nigerian bank rails with sponsored gas, plus an onboarding campaign across West African developer communities.

DONE WHEN: Mainnet live, a real fiat payout, public metrics dashboard

BUSINESS MODEL

Three revenue streams, all charging today.

OFF RAMP

1%

USDC to naira conversion

Returned live by our public fee endpoint today. Not a projection.

ESCROW AND SERVICE AGREEMENTS

2.5%

on naira, 1.5% on USDC

Priced per currency, plus a fixed component of NGN 50 or \$0.50.

PEER TO PEER TRANSFERS

Under \$100	0.50%
\$100 and above	0.25%
Minimum per transfer	\$0.25
New recipient account	\$0.30
The floor covers gas and rail cost.	

Why the floor matters

A \$20 transfer pays 1.25% effective, not 0.50%, because the \$0.25 floor dominates until roughly \$50. Small transfers stay profitable.

Take rate against the market

Traditional remittance into Nigeria costs 5 to 10 percent. We clear the same corridor at 1 percent and still hold a margin on all three streams.

We wrote the contract, so we owe you the audit.

What we have done

- Escrow settles through x402, a reviewed open standard
- 34 unit tests and 6 invariants on our own vault
- Five money-affecting bugs found and fixed pre-deploy
- Atomic double entry ledger, tests assert refusals

What we still owe you

- No third party audit of our vault has been done
- It is not yet deployed to any public network
- External review is budgeted inside Milestone 1
- Mainnet only after that review clears

We use x402 as a client, through the PayAI facilitator. We do not claim to have written it. What we did write is the vault, and testing it surfaced five bugs that would have moved money wrongly. That is why we are asking for an audit.

TEAM

Building for the market we live in.

Samson Micheal

Founder, CEO and Technical Product Engineer

Full stack fintech engineer in Abuja. Built the ledger, settlement engine, identity layer and chat interfaces running in production today.

Jonathan Hart

Co Founder, Operations and Growth

Emerging market merchant onboarding and creator network distribution. Leads acquisition across West African freelance and agency communities.

Why this team

- **We are the user.** Cross border payment friction is a daily fact here, not a market study.
- **Shipped, not specced.** A live production system with real bank settlement already exists.
- **Compliance first.** Identity verification and AML policy were built before growth.
- **Bootstrapped.** No outside capital raised to date.

THE ASK

\$25,000 in STRK to put a working fiat corridor on Starknet.

The product exists and settles real money today. What it does not have is Account Abstraction, sponsored gas and our vault deployed on Starknet. That is what this grant buys, and all of it ships open source.
